CLAIM

1. A fuel oil composition for diesel engines comprising a base stock which satisfies the following relationships (1), (2) and (3), contains sulfur at 0.05wt.% or less, and is incorporated with 0.01 to 0.10wt.% of a flow improver and 0.002 to 0.1wt.% of a lubricity improver:

(a)
$$0 < A + 4.0$$

wherein, A is content (wt.%), based on the total normal paraffin compounds present in the base stock, of normal paraffin compounds having a carbon number of 20 or more,

(b)
$$0.04 \quad [B/C] \quad 0.40$$
 (2)

wherein, B is content (wt.%) of normal paraffin compounds having a carbon number of (n + 5), C is content (wt.%) of normal paraffin compounds having a carbon number of (n), [B/C] is average B/C ratio, and (n) is a positive integer when total content of normal paraffin compounds having a carbon number of (n) or more is 3.0 wt.% or less and closest thereto, based on the total normal paraffin compounds in the base stock, and

(c).
$$0 < D = 8.0$$
 (3)

wherein, D is content (vol.%), based on the whole base stock, of polynuclear aromatic hydrocarbon compounds.
